Lepidodactylus lugubris (Mourning Gecko). Distribution.

Dates of observation: four, between 28 July 2011 and 30 September 2013. Location: Guadeloupe, Basse Terre, Lachaise. Coordinates: 16.317389, -61.697778. Elevation: 62 m. Voucher: image by P. Parmentier. This invasive species has been reported at several locations on Grande Terre, Guadeloupe (O. Lorvelec, A. Levesque, and A. M. Bauer, 2011, *Herpetology Notes*, 4: 291-294; R. Gomès, and B. Ibéné, 2013, Caribbean Herpetology, 44:1). Here, we confirm that it is now established on Basse Terre. Adults and juveniles were seen inside and outside of a house in Lachaise. Another introduced gecko, *Hemidactylus mabouia*, was present but no interactions between the two species were observed.
